The Consolidated Framework for Implementation Research (CFIR)

(Damschroder LJ, et al; 2009)
Ecology of Implementation

• List out the different intervention/practice/program etc., you are considering to implement in your organization.

• Identify all the different associations that touch or are networked to your (insert intervention/practice/program here).

• As a table group come to consensus on a network in an organization.
Examining the Value of the Network

- What data is attached or attributed to the associations of (e.g. encounter data) the intervention/practice/program?

- How may they influence implementation?

"After closer investigation, it's become clear that we need to enter more than one value."
Developing the Data Map

• Who should be the key people in being a part of the network?

• Identify how the data maps back to those key people.
Wrong Turns Happen....

- Identify the pot holes that come. How do you know they are there?

- What are some possible strategies to get back on track?
